This invention relates to the cDNA and protein sequences of a novel than aggrecanase polypeptide. The protein of the invention may be used to inhibit the proteolytic activity of aggrecanase, or to inhibit the aggrecanase wediated cleavage of aggrecan in cartilege. The expression of the invention is useful for developing inhibitors of aggrecanase protein. The cDNA sequence encoding the aggrecanase protein of the invention is useful for designing probes for obtaining DNA sequences encoding other aggrecanase molecules. The cDNA sequence is also useful for detecting mRNA encoding aggrecanase in a given cell coppulation, and thus for detecting or disgnosting genetic disorders convolving the aggrecanase is irregularly transcribed or tissue disorders in which aggrecanase is irregularly transcribed or expressed. The DNA sequences may also be useful for preparing vectors for gene therapy applications. An inhibitor of the protein is useful continuacy by blocking the enzyme's proteolytic activity. An aggrecanase protein inhibitor and a method for inhibition of its activity aggrecanase protein vectors cartilage, by blocking the enzyme's proteolytic activity. An are useful for treating various aggrecanase—sescoideted conditions including osteoarthritis and other inflammatory diseases. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                              The invention relates to an isolated or substantially pure von Willebrand factor-cleaving protease (wWF-cp) polypeptide. wWF-cp is useful for controlling which involves providing wWF-cp as a ligand, contacting a solution comprising wWF with the polypeptide ligand under conditions where wWF is bound to the ligand and recovering from the ligand purified where wWF wWF-cp is useful for producing anti-vWF cp polypeptide antibodies wWF cp polypeptide antibodies wWF cp polypeptide antibodies from the animal. wWF-cp and isolating the anti-cwWF cp polypeptide antibodies from the animal. wWF-cp is useful for tromboembolic disease such as thrombotch thrombocytopaenia or thromboembolic disease such as thrombotch thrombocytopaenia or heamolytic-uraemic syndrome. wWF-cp and also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                         Novel isolated or substantially purified Von Willebrand factor-cleaving procease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TEPEGAPNITANLTSSLLSVCGWSQTINPEDDTDPGHADLVLYITRFDLELPDGNRQVRG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a human ADAM-TS-like protein and the polynucleotide encoding it. The protein of the invention is useful for treating cardiovascular disorders including diseases of the heart and vascular system, such as congestive heart failure, myocardial infarction, ischaemic heart diseases (e.g., stable angina, unstable angina), artial cand ventricular arrhythmia, hypertensive vascular diseases (e.g., all cardiovascular diseases (e.g., all carterial thrombosis and embolism, inflammatory vascular disease, acute are useful in diagnostic assays for detecting diseases and abnormalities or musceptibility to diseases and abnormalities related to the presence of mutations in the nucleic acid sequences which encode the protein. The sequences are also useful for modulating ADAM-TS-like protein activity in a disease condition. This sequence represents the human ADAM-TS-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to an isolated or substantially pure von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for comprising vWF with the polypeptide ligand under conditions solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified where vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunishing an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for twe producing a preparation of prophylaxis and threapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura (TTP), thench-Schonlain purpura, precelampais, neonatal thrombocytopaenia or haemolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Osteoarthritis, rheumatoid arthritis, inflammatory bowel disease; Crohn's disease; asthma; Alzheimer's disease; organ transplant rejection; cachexia; alsergy; cancer; leukaemia; lymphoma; osteoporosis; atheroseis; congestive heart failure; myocardial infarction; stroke; neurodegenerative disease; autoimmune disorder; Huntington's;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 TEPEGAPNITANLISSLLSVCGWSQTINPEDDIDPGHADLVLYITRFDLELDDGNRQVRG 120

```

```
The present sequence represents a ADAMTS protein, designated ADAMTS-M, that exhibits the characteristics of the ADAM (A Disintegrin And that exhibits the characteristics of the ADAM (A Disintegrin And Metalloproteases) and contains a thrombospondin domain (TS). The protein is encoded by the CDNA given in the specification describes a newly isolated polynucleotide, comprising a nucleotide sequence encoding an ADAMTS-M polypeptide as a given in the specification, one metalloproteinase, disintegrin domain, prodomain or its thrombospondin submotif. The polynucleotide, polypeptide and agent are useful for manufacturing a medicament for treating a subject in need of altering activity or expression of ADAMTS-M. The polynucleotide, ADAMTS-M polypeptide and agent are useful for manufacturing a medicament for treating architis (setcoarthritis and rheumatoid arthritis), inflammatory bowel disease, Crohn's disease, ashima, Alzheimer's disease, organ transplant toxicity and rejection, cachexia, allergy, cancer (e.g. solid tumour cancer including colon, breast, lung, prostate, brain or haematopoietic malignancies including lenkaemia and lymphoma), osteoprosis, atherosclerosis, aortic aneurysm, congestive heart fallure, myocardial infarction, stroke, head trauma, spinal cord injury, neurodegenerative disease, Parkinson's disease, sutchimmune disorders, spinal cord injury, neurodegenerative disease, pain, depression, suntriple sclerosis, abnormal wound healing, burns, infertility or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal wWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thrombombombolic disease such as thrombocic thrombocytopaenia or haemolytic unramic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp contin. vWF-cp gene is located on chromosome 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, zdint5; anti-angiogenic; intestinal polypeptide; wound healing;

The present sequence represents a human zdint5 polypeptide. The zdint5 polypeptide is an anti-angiogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is useful as a tool for identifying new family members of polypeptide is useful as a tool for identifying new family members of polypeptides. Zdint5 polypeptides are used to to clone 5' non-coding regions of zdint5 gene. Zdint5 polypeptides are used for tumour suppression, gamete matrix intesting in isolation or in and growth and differentiation either working in isolation or in certis and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery after gastrointestinal irradiation, chemotherapy or antibody use, and extracellular matrix repair and remodeling. The polypeptides are also useful for modulating proteolysis, wepoptosis, angiogenesis, infection, cell adhesion, cell fusion and signalling. The polypeptides are also useful for treating tumour formation, Crohn's degenerative diseases, disorders related to immunity, inflammation, is also the maturation, immunology, trauma and epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61

The present sequence represents a human zdint5 polypeptide. The zdint5 polypeptide is an anti-angiogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is polypeptide is useful as a tool for identifying new family members of polypeptides. Zdint5 polymucleotides are useful as probes or primers to clone 5, non-coding regions of zdint5 gene. Zdint5 polypeptides are used for tumour suppression, gamete maturation, immunologic recognition, and growth and differentiation either working in isolation or in conjunction with other molecules in colon, small intestine, fetal lung, testis and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery
                                                                                                                                                                                                                                           extracellular matrix interaction; tumour suppression; gamete maturation; immunologic recognition; gastrointestinal irradiation; chemotherapy; proteolysis; apoptosis; anglogenesis; infection; cell adhesion; cell signalling; tumour; Crohn's disease; melanoma; trauma; inflammatory bowel disease; food poisoning; degenerative disease; inflammatory inflammatory, ford poisoning; degenerative disease; inflammation; fertility; gamete maturation; epithelial disorder.

after gastrointestinal irradiation, chemotherapy or antibody use, as anti-infectives, and extracellular matrix repair and remodeling. The polypeptides are also useful for modulating proteolysis, apoptosis, and ection, cell adhesion, cell fusion and signalling. The polypeptides are also useful for treating tumour formation, Crohn's disease, inflammatory bowel disease, food poisoning, melanoma, degenerative diseases, disorders related to immunity, inflammation, fertility, gamete maturation, immunology, trauma and epithelial

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cycostatic; hepatoriopic; vulnerary; antiparkinsonian; nootropic; neuroprotective; csteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; antidingla antisheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus cryclinal or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocurnal haemoglobinuria, antiniflammatory disease, to enhance
                    Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          coagulation, to inhibit thrombosis, and as a contraceptive
                                                                                                                                           Claim 11; Page 4050; 5507pp; English.

the described suppose that the subject of the subject of the subject of the subject of the subject has or is at risk of developing a titin-related disease or condition. The method compiles analysing a titin-related a sample from the subject and detecting the presence of a mutation (e.g. the pickwick mutation in the cardiac specific exon N2B) in the titin gene, which indicates that the subject has or is at risk of developing a titin-related disease. The zebrafish which has a phenotype similar to mammalian heart failure is used as a model. The method is useful for detecting an increased likelihood of heart disease, such as heart failure, in a patient, so that appropriate intervention can be instituted before any symptoms occur. The method may also be used to carlitrate determination of etiology of an existing heart condition, such as heart failure, to identify compounds that can be used to treat or prevent heart conditions, in prenatal genetic screening, e.g. to identify parents who may be carriers of a recessive titin mutation. Compounds identified using the methods may be used to treat patients. The have or are at risk of developing heart disease, e.g. heart Gaps 490 ELKSRTKEIITTKQEQMHVTHEQIRKETEKTFVPKVVISAAKAKEQETRISEEITKKQKQ 549 190 ELLVOGEEEVPAKKTKTIVSTAQISESRQTRIEKKIEAHFDARSIATVEMVIDGAAGQQL 249 309 370 IRTEERWEGRYGVQEQVTISGAAGAAASVSASASYAAEAVATGAKEVKQDADKSAAVATV 429 430 VAAVDMARVREPVISAVEQTAQRTTTTAVHIQPAQEQVRKEAEKTAVTKVVVAADKAKEQ 489 550 VTQEAIMKETRKTVVPKVIVATPKVKEQDLVSRGREGITTKREGVQITQEKMRKEAEKTA 609 18 610 LSTIAVATAKAKEQETILRTRETMATRQEQIQVTHGKVDVGKKAEAVATVVAAVDQARVR 669 13 **EPREPGHLEESYAQQTTLEYGYKERISAAKVAEPPQRPASEPHVVPKAVKPRVIQAPSET** 12 ------250 PHKTPPRIPPKPKSRSPTPPSIAAKAQLARQQSPSPIRHSPSPVRHVRAPTPSPVRSVSP Determining if a subject has or is at risk of developing a titin-related disease or condition, particularly heart failures, comprises detecting the presence of a mutation in the titin gene Indels 24887; 35.2%; Score 272; DB 22; Length 26926; 8 sequence representing human titin (also known 23; ilarity 0.4%; Pred. ```
AAC 74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatocropic; vulnerary; artiporiatic; antiporhatic; neuroprotective; coreopathic; anticonvulsant; antiarthritic; immunosuppressant; coreopathic; anticonvulsant; antiarthritic; immunosuppressant; cartifiabetic; hypotensive; dermatological; immunosuppressive; artifiabetic; hypotensive; dermatological; immunosuppressive; antiantensement. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the proteins associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders ostcoarthritis, coretters of disorders, neurodegenerative disorders ostcoarthritis, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus cythematosus, severe combined immunodeficiency (SCID), AIDS, viral, altergies, aplastic anaemia, burns, wounds, bone and cartilage damage, cadaman, untinflammatory disease; to enhance consulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13;

```
This invention relates to murine and human ADAMTS-N (A disintegrin-like and metalloprotease domain with thrombospondin type I motifs) proteins, designated ADAMTS-S, 6, 7, 8, 9, 10 and Rl. Also included in the convention are cDNA sequences encoding the proteins, and antibodies invention are cDNA sequences encoding the proteins, and antibodies conspecific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, disgnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated to using the nucleic acids, proteins and antibodies include, for example themore cachexia, inflammation, dermatosparaxis in cartile or Enters-Danlos tumour cachexia, inflammatory and non-inflammatory) disease, and they may also be used for angiogenesis tumour growth and metastases, and they may also be used for controlling embryogenesis and implantation of fertilised, eggs. The present sequence represents human ADAMTS-7 gene is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Murine and human 'A Disintegrin-like And Metalloprotease domain with ThromboSpondin type I motifs' proteins and the nucleic acids encoding them, useful for treating e.g. tumours, inflammation and arthritis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               53 AGGSFLSYELWPRALRKRDVSVRRDAPAFYELQYRGRELRFNLTANQHLLAPGFVSETRR 112

(I) may be used to screen for substances (S) that may modulate its activity. Administering S (which modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or haematopoietic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, sexual dysfunction, mood disorders, attention disorders, cognition
                                                                                                                                                                                                                                                                                                           vasotropic; antimigraine; analgesic; endocrine; nootropic; tranquiliser; hypotensive; neuroleptic; neuroprotective; anabolic; antimiflammatory; asparryl protease; cysteine protease; metalloprotease; serine protease; cancer; haematopoietic; breast; colon; lung; prostrate; cervical; brain; ovarian; bladder; kidney; pain; immune-related disease; cardiovascular disease; neuronal disease; migraine; sexual dysfunction; mood disorder; attention disorder; cognition disorder; hypotension; psychotic disorder; dyskinesia; metabolic disorder; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders, hypotension, hypertension, psychotic disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders. (I) may also be useful as a diagnostic tool for a disease or disorder such as those above. AAU72876-AAU72910 represent human protease amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel protease polypeptide useful for screening for substances that may be used to treat, e.g., cancers, immune-related diseases, cardiovascular disease, migraine, pain, psychotic and inflammatory

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                         SEQID_15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                  The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving procease (VWF-cp) polypeptide. VWF-cp is useful for purifying VWF which involves providing VWF-cp as a ligand, concacting a solution comprising VWF with the polypeptide ligand under conditions where VWF is bound to the ligand and recovering from the ligand purified where VWF-cp is useful for producing anti-VWF cp polypeptide antibodies which involves immunising an animal with VWF-cp and isolating the anti-VWF cp polypeptide antibodies from the animal. VWF-cp is useful for two polypeptide antibodies from the animal. VWF-cp is useful for thromboembolic disease such as thrombot, thrombocytic purpura (TTP), thench-Schonlein purpura, preclampsia, neonatal thrombocytopaenia or heamolytic-uraemic syndrome. VWF-cp can also be used for processing plasmatic or recombinantly produced VWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human VWF-cp
                                                                                                                                                                                                                                                                                                                                                     ö
                                    Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura

This invention relates to the CDNA and protein sequences of a novel
human aggrecanase polypeptide. The protein of the invention may be
used to inhibit the proteolytic activity of aggrecanase, or to inhibit
the aggrecanase-mediated cleavage of aggrecan in cartilage. The
protein of the invention is useful for developing inhibitors of
aggrecanase protein. The CDNA sequence encoding the aggrecanase protein
of the invention is useful for designing probes for obtaining DNA

The invention relates to an isolated or substantially pure von Willebrand factor-cleaving protease (wWF-cp) polypeptide. wWF-cp is useful for purifying wWF which involves providing wWF-cp as a ligand, contacting a solution comprising wWF with the polypeptide ligand under conditions where wWF is bound to the ligand and recovering from the ligand purified comprising wwF with the polypeptide ligand under conditions where wWF is useful for producing anti-wWF or polypeptide antibodies from the animal. wWF-cp and isolating the anti-crow wWF or polypeptide antibodies from the animal. wWF-cp is useful for thromboembolic disease such as thrombott thrombocytopaenia or thromboembolic disease such as thrombott thrombocytopaenia or haemolytic-uraemic syndrome. wWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Osteoarthritis; rheumatoid arthritis; inflammatory bowel disease; Crohn's disease; asthma; Alzheimer's disease; organ transplant rejection; cachexia; alseasy, cancer; leukaemia; lymphoma; osteoporosis; atherosclerosis; congestive heart failure; myocardial infarction; stroke; neurodegenerative disease; autoimmune disorder; Huhtington's;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated or substantially purified Von Willebrand factor-clea protease, useful for producing preparation for therapy of thrombosiand thromboembolic disease such as thrombotic thrombocytic purpura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 AVGPDVFQAHQEDTERYVLTNLNIGAELLRDPSLGAQFRVHLVKMVILTEPEGAPNITAN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a human ADAM-TS-like protein and the polynucleotide encoding it. The protein of the invention is useful for treating cardiovascular disorders including diseases of the heart and vascular system, such as congestive heart failure, myocardial infarction, ischaemic heart diseases (e.g., stable angina, unstable angina), atrial chromboat arrhythmia, hypertensive vascular diseases (e.g., all kinds of secondary arterial hypertension), and peripheral vascular diseases (e.g., all chrombosis and embolism, inflammatory vascular disease, acute arterial thrombosis and embolism, inflammatory vascular disease. The sequences are useful in diagnostic assays for detecting diseases and abnormalities or susceptibility to diseases and abnormalities related to the presence of mutetions in the nucleic acid sequences which encode the protein. The sequences are also useful for modulating ADAM-TS-like protein activity in a disease condition. This sequence represents the human ADAM-TS-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; Von Willebrand factor-cleaving protease; vWF-cp; therapy; enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombootic thrombootic thrombootic propura; TTP; Henoch-Schonlein purpura; thromboots; neonatal thrombocytopaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                            The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (wWF-cp) polypeptide. wWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thrombombombolic disease such as thrombosic thrombosic purpure (TTP), Henoch-Schonlein purpure, precelampsia, neonatal thrombosytopaenia or haemolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp protein. vWF-cp gene is located on chromosome 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, zdint5; anti-angiogenic; intestinal polypeptide; wound healing;

The present sequence represents a human zdint5 polypeptide. The zdint5 to polypeptide is an anti-anglogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is useful as a tool for identifying new family members of polypeptides. Zdint5 polypeptides are useful as probes or primers to folypeptides. Zdint5 polypeptides are used for tumour suppression, gamere maturation, immunologic recognition, and growth and differentiation either working in isolation or in ceris and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery after gastrointestinal irradiation, chemotherapy or antibody use, as anti-infectives, and extracellular metrix repair and remodeling. The polypeptides are also useful for modulating proteolysis—rapoptosis, angiogenesis, infection, cell adhesion, cell fusion and signalling. The polypeptides are also useful for treating tumour formation, Crohn's degenerative diseases, disorders related to immunity, inflammation, financiallity, gamete maturation, immunology, trauma and epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The zdint5 polypeptide is an anti-angiogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is polypeptide is useful as a tool for identifying new family members of polypeptides. Zdint5 polynucleotides are useful as probes or primers to clone 5' non-coding regions of zdint5 gene. Zdint5 polypeptides are used for tumour suppression, gamete maturation, immunologic recognition, and growth and differentiation either working in isolation or in conjunction with other molecules in colon, small intestine, fetal lung, testis and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery
                                                                                                                                                                                                                                                                extracellular matrix interaction, tumour suppression; gamete maturation; immunologic recognition; gastrointestinal irradiation; chemotherapy; proteolysis; apoptosis; anglogenesis; infection; cell adhesion; cell fusion; cell signalling; tumour; Crohn's disease; melanoma; trauma; inflammatory bowel disease; food poisoning; degenerative disease; inflammatory, sowel disease; cod poisoning; degenerative disease; inflammation; fertility; gamete maturation; epithelial disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New anti-angiogenic intestinal polypeptides, zdint5 polypeptides, which are members of disintegrin proteases, for modulating extracellular matrix interaction, tumour suppression and wound healing
